NOTIFICATION DATE

DELIVERY MODE

01/15/2009

ELECTRONIC

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

ip.department.us@nxp.com

Office Action Summary	Application No. 10/564,293	Applicant(s) WETZKER ET AL.	
	Examiner EBONI GILES	Art Unit 4133	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 10 January 2006.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-10 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-10 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☒ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Priority

1. Acknowledgment is made of applicant's claim for foreign priority under 35 U.S.C. 119(a)-(d). The certified copy of European Patent No. 03102094.4, filed on July 10, 2003, has been received in this National Stage Application PCT/IB04/051096, filed on July 1, 2004, from the International Bureau.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

3. Claims 1, 2, 5-10 are rejected under 35 U.S.C. 102(e) as being anticipated by US Patent Application Publication 2004/0057534 to Masenten et al. (“Masenten”).

Regarding Claim 1, Masenten discloses that a “receiver comprising a receiving stage for receiving frequency signals; a mixing stage coupled to the receiving stage for generating converted frequency signals, a modulating stage coupled to the mixing stage for delta-sigma modulating the converted frequency signals; a filtering stage coupled to the modulating stage for filtering the delta-sigma modulated converted

Art Unit: 4133

frequency signals,” where, in a third embodiment, the receiver includes an integrated low noise amplifier (LNA) which may utilize one broadband or multiple narrow band low noise amplifiers for amplifying received RF signals...The output of the active LNA is inputted to an in-phase (I)-path mixer and quadrature (Q)-path mixer, each of whose function is to translate the center frequency of the desired RF signal by a local oscillator frequency, f_{LO} , to an intermediate frequency, f_{IF} (¶0030, Fig. 3, elements 10, 110, 120A, 120B) and further discloses in a fourth embodiment where the output of each mixer is coupled to a delta-sigma modulator respectively through Node 1. Node 1 is implemented as an IF filter that provide both a tuned output for the corresponding mixer and a bandpass centered at the IF frequency for the first stage of the corresponding delta-sigma modulator (¶ 0029, 0034, Fig. 4a, elements 120A, 120B, 130A, 130B, 140A, 140B).

Regarding Claim 2, Masenten discloses a receiver as recited in Claim 1 and further discloses that the modulating stage comprises a delta-sigma modulator comprising a low-pass filter; a quantizer coupled to the low-pass filter; and a digital-to-analog converter for feeding back an output of the quantizer to an input of the low-pass filter,” where the output of each delta-sigma modulators is coupled to a decimation filter. Each decimation filter filters and decimates the output signal from the respective delta-sigma modulator to forma high resolution digital signal at a sampling rate where MD is the decimation ratio of the decimation filter. The decimation

filter divides down the sampling rate of the digital signal by MD. Each decimation filter has a lowpass frequency response (¶ 0036-0038, Fig 6A-6C, elements 140A, 140B, 150A, 150B).

Regarding Claim 5, Masenten discloses a receiver as recited in Claim 1 and further discloses that “the mixing stage comprises a mixer and the modulating stage comprises a delta-sigma modulator,” where the mixers decompose the received signal into in-phase and quadrature phase components. The I mixer outputs the in-phase component of the received signal at the IF and the Q mixer outputs the quadrature component of the received signal at the IF (¶ 0032, Fig. 4a, elements 120A and 120B) and further discloses that the delta-sigma modulator includes a lowpass filter for a follow-on Node within the delta-sigma modulator. The bandpass filters of Node 1 and the lowpass filter for the follow-on Node result in both a signal transfer function (STF) and noise transfer function with a bandpass transfer function centered at the IF frequency. This provides rejection of DC and 1/f noise components from the respective mixer and also provides IF pre-filtering to attenuate signals outside of the channel bandwidth of the desired signal (¶ 0035, Fig. 4a, elements 140A, 140B).

Regarding Claim 6, Masenten discloses a receiver as recited in Claim 1 and further discloses in a fifth embodiment that the receiver may utilize one broadband DLNA to amplify both frequency bands...the differential output of the DLNA is coupled to both the in-phase mixer and

Art Unit: 4133

the quadrature mixer. The in-phase mixer receives a differential in-phase local oscillator signal and the quadrature mixer receives a differential quadrature local oscillator signal from the clock generation and distribution circuit. The output of the I mixer is coupled to the I delta-sigma modulator via the I-path IF filter and the output of the mixer is coupled to the Q delta-sigma modulator via the Q-path IF filter (¶ 0046, Fig. 5, elements 110, 120A, 120B, 122B, 130A, 130B, 140A, 140B).

Regarding Claim 7, Masenten discloses "a system comprising a transmitter and comprising a receiver," where high frequency signals are received through an antenna and inputted to a duplexer...The duplexer couples the receive signal to the receiver and couples transmit signals from the transmitter to the antenna (¶ 0026, Fig. 1, elements 10, 20, 22, 23, 25). The receiver is drawn to the apparatus recited in Claim 1 and rejected for the same reasons of anticipation above.

Process claim 8 is drawn to the method of using the corresponding apparatus claimed in claim 1. Therefore, process claim 8 corresponds to apparatus claim 1 and is rejected for the same reasons of anticipation above.

As to Claims 9 and 10, they are rejected for the same reasons indicated above because they recite similar limitations claimed in Claim 1.

Claim Rejections - 35 USC § 103

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

Art Unit: 4133

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

5. Claim 3 is rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent Pub. 2004/0057534 to Masenten et al. ("Masenten") as applied to claim 2 above and in view of US Patent 7,194,036 to Melanson.

Regarding Claim 3, Masenten discloses a receiver as recited in Claim 2.

Masenten does not expressly disclose that the low-pass filter comprises a time-continuous filter.

Melanson discloses that "the low-pass filter comprises a time-continuous filter," where the first delta-sigma modulator has a low-pass STF (signal transfer function) defined by a complex set of poles (Col. 6, lines 15-16) where a signal transfer function with a set of poles is indicative of a time-continuous filter.

6. Claim 4 is rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent Pub. 2004/0057534 to Masenten et al. ("Masenten") as applied to claim 1 above and in view of US Patent 7,130,327 to Robinson et al. ("Robinson").

Regarding Claim 4, Masenten discloses a receiver as recited in Claim 1.

Masenten does not expressly disclose a further mixing and filtering stage.

Robinson does expressly disclose “a further mixing stage coupled to the filtering stage for generating baseband signals; and a further filtering stage coupled to the further mixing stage for channel selective filtering the baseband signals,” where the filter is operative to mitigate quantization noise and noise that has been shifted or shaped to out-of-band frequencies by the delta-sigma modulation implemented by the modulator. The filter output signal can be passed to an amplifier operative to amplify the selected signal pattern to provide an output signal at a desired level. The amplified signal can be provided as a local oscillator signal to drive a mixer such that the signal operates as a carrier frequency for transmission of wireless communication signals or for up or down conversion in a transceiver (Col. 8, lines 18-28).

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to EBONI GILES whose telephone number is (571)270-7453. The examiner can normally be reached on Monday through Friday 7:30 AM to 5:00 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Abul Azad can be reached on (571) 272-7599. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
